PREFACE

Calcium Aluminates constitute the primary components of Calcium Aluminate Cements (CACs), also known as high-alumina cements (HAC) and sometimes also aluminous cements. In fact they are a range of cements in which calcium aluminates are the principal constituents.

Since the last International Conference (the Centenary Conference) in 2008, we have seen an increase in the use of these cements as a component to make blended cements, with different hydration products. These can be in binary systems, for instance with ground granulated blast-furnace slag or in ternary systems, usually with calcium sulfate and a source of lime (such as Portland cement). Manufacturers of CACs have also introduced new grades of milled calcium aluminates destined for use as components in such blended formulations so having considered this we have dropped the ‘cement’ part of the title. By doing this we are also recognising papers that feature the use with CACs of calcium aluminate aggregate.

This is now the fourth open International Conference on calcium aluminate cements with previous meetings in London in 1990, Edinburgh in 2001 and more recently the Centenary Conference in Avignon in 2008. The Proceedings of three previous meetings are still widely used as standard texts on CACs, and we anticipate that the same will be true of these Proceedings.

The response to the call for papers has been excellent, and these Proceedings demonstrate a growing interest and real progression in the knowledge and understanding about this class of cement. Not only do we see a continued drive to better understanding of alternative hydratable aluminates but also further exploration in the use of the already mentioned blended systems with papers covering issues such as ageing and effective admixtures for formulated systems, destined for building chemistry and also refractory use.

CACs have always found their way into a wide range of applications and this range seems to be expanding with papers on new areas, such as for dental cements and also use as an admixture, including as an admixture to improve lime based architectural mortars. Their merit in architectural applications is shown by papers dealing with fungal and bacterial attack on concretes. Resistance to biological attack is demonstrated by an excellent set of papers related to biogenic attack consistent with increasing use worldwide as the cement of choice for sewer pipes, especially in warm climates.

It is sometimes difficult to select the best sequence for papers but for this meeting it has been a relatively simple choice as the environmental aspects of CACs are of common interest for all. The opening paper demonstrates the role of CACs as an enabling technology to improving the life cycle analysis (LCA) of drymix formulations.

We would like to thank all the authors for their hard work in preparing their contributions and for meeting the rather tight deadlines that have enabled these Proceedings to be ready in time for the conference. The papers included in these Proceedings have all been reviewed by members of the Scientific Review Panel who have willingly given up their time to read the manuscripts carefully and offer the authors

valuable assistance in refining their papers. We are profoundly grateful to them all as we are to our Scientific Advisors who have provided constant support throughout.

The Editors would like to thank Kerneos Aluminate Technologies, Calucem, Cementos Molins, Çimsa Cement and Górká Cement for their unfailing financial and practical support for this meeting – without their assistance the Conference would not have been possible. In particular, we acknowledge Francois Saucier (Kerneos), Frank Michael Kindler (Calucem), Antonio Bedmar (Cementos Molins), Tuğhan Delibaş (Çimsa Cement) and Piotr Palichleb (Górká Cement), who have been of particular help with the practicalities of organising this event. We also wish to thank the Institute of Materials, Minerals and Mining (IOM³) for their support and assistance in various ways and in particular for promoting the meeting on their website.

Finally, but certainly not least, the Editors would like to extend particular thanks to Jonathan Silver and Yvonne Wilder of IHS BRE Press for all their hard work in the production of these Proceedings.

The Editors express the wish, on behalf of all authors, that readers find the volume topical and useful in their work: also, that it stimulates further work on this interesting and useful class of materials.

Glossary of terms and abbreviations

Cement chemists' shorthand is widely used in these proceedings wherein the following abbreviations are used:

C	CaO
S	SiO ₂
A	Al ₂ O ₃
F	Fe ₂ O ₃
Š and \$	SO ₃

Some examples:

CA	mono calcium aluminate (CaO·Al ₂ O ₃)
C ₄ AF	tetracalcium aluminoferrite (4CaO·Al ₂ O ₃ ·Fe ₂ O ₃)
C ₃ A·CŠ·H ₁₂	calcium monosulfoaluminate (4CaO·Al ₂ O ₃ ·SO ₃ ·12H ₂ O), also called AFm or monosulfate
AH ₃	gibbsite (Al ₂ O ₃ ·3H ₂ O)
CAH ₁₀	monocalcium aluminate deca hydrate (CaO·Al ₂ O ₃ ·10H ₂ O)
CŠH ₂	calcium sulfate di hydrate (CaO·SO ₃ ·2H ₂ O), also called gypsum

Some commonly used abbreviations related to cement(s):

AFm	monosulfate
AFt	ettringite
CA	mono calcium aluminate
CAC	calcium aluminate cement
HAC	high alumina cement
CH	calcium hydroxide
C ₄ AF	tetracalcium aluminoferrite (ferrite)
ggbs	ground granulated blast-furnace slag
LCC	low cement castables
LOI	loss on ignition
OPC	ordinary Portland cement
pfa	pulverised-fuel ash
w/c	water/cement ratio
w/s	water/solid ratio

CONTENTS

Preface	v
Organising Committee, Scientific Advisors and Scientific Review Panel	vii
PART ONE – INTRODUCTION	1
1 Environmental footprint of Calcium Aluminate Cements (CAC) E. Henry-Lanier, B. Espinosa and C. Eychenne-Baron	3
2 Quantitative and qualitative analysis of CAC and its hydrate products S. Ng and T. Hjellström	17
PART TWO – CALCIUM ALUMINATES AND THEIR HYDRATION	31
3 Mineral composition and hydration of a $C_{12}A_7$ rich binder B. Touzo and P. A. Andreani	33
4 Ultra fast hydration opening new application fields: a comparison of different calcium aluminate technologies H. Fryda, J. Estival, S. Berger, F. Bordet, P. A. Andreani, A. Martinet and P. Brigandat	42
5 Kinetics of CA and CA_2 dissolution determined by QXRD and corresponding enthalpies of reactions F. Goetz-Neunhoeffler, S. R. Klaus and J. Neubauer	54
6 Application of heat flow calculation to synthetic calcium aluminate cement mixes S. R. Klaus, J. Neubauer, F. Goetz-Neunhoeffler, A. Buhr and D. Schmidtmeier	65
7 Crystal structures and XRD data of new calcium aluminate cement hydrates H. Pöllmann, R. Kaden and S. Stöber	75
PART THREE – RELATED PHASES AND THEIR STRUCTURES	87
8 Synthesis and crystal chemistry of strontium aluminates H. Pöllmann, S. Stöber, P. Mohr and R. Kaden	89
9 Mono- (strontium-, calcium-) aluminate based cements H. Pöllmann and R. Kaden	99
10 Synthesis and crystal chemistry of manganese containing perovskites: phases with perovskite structures S. Stöber, H. Pöllmann, G. Redhammer and S. Schorr	109
11 Hydraulic phases in the system $BaO-Al_2O_3$ R. Kaden and H. Pöllmann	120
12 Hydration and properties of calcium magnesium aluminate cement J. M. Auvray, H. Fryda, C. Zetterstrom, C. Wöhrmeyer and C. Parr	130

13	Investigations on the hydratable compounds in the CaO-Al ₂ O ₃ -ZrO ₂ system D. Madej, J. Szczerba and W. Kagan	140
PART FOUR – BLENDED CEMENT SYSTEMS		151
14	Thermodynamic modelling of effect of time and silica on the conversion process B. Lothenbach	153
15	Hydration study of a calcium aluminate cement blended with anhydrite G. Le Saout, B. Lothenbach, F. Winnefeld, P. Taquet and H. Fryda	165
16	Impact of different calcium sulfate sources on the early hydration of two different grades of calcium aluminate cement C. Stabler, C. Breunig, F. Goetz-Neunhoeffler, J. Neubauer, H. Fryda and R. Kwasny-Echterhagen	177
17	Hydration of calcium aluminate cement based systems with calcium sulfate and limestone J. Bizzozero and K. L. Scrivener	189
18	Impact of calcium sulfate type on hydration and properties of ettringite systems S. Berger, H. Fryda, D. Niepmann, D. Turlakis and F. Bordet	197
19	Parametric study of binary and ternary ettringite-based systems I. Martin, C. Patapy and M. Cyr	210
20	Course of hydration of ferrite phase in a ternary binder model mix J. Neubauer, D. Ectors and F. Goetz-Neunhoeffler	222
21	Hydration and microstructure of rapid-strength binders based on OPC accelerated by early ettringite formation J. Bizzozero and K. L. Scrivener	231
22	Long-term hydration and mechanical behaviour of Portland cement, calcium aluminate cement and calcium sulfate blends D. Torrens-Martín and L. Fernández-Carrasco	242
PART FIVE – VOLUME STABILITY		251
23	Ultra high early strength shotcrete: new binder composition approach J.-D. Lemay, M. Jolin and R. Gagné	253
24	Effect of temperature on length change of cementitious material using Portland cement – calcium aluminate cement - anhydrite - blast furnace slag system H. Mori, E. Maruya, A. Sasaki and T. Takahashi	265
25	Volume stability of CAC-CaSO ₄ -CaCO ₃ -H ₂ O systems during drying L. Baquerizo, T. Matschei and K. L. Scrivener	274
26	Expansion mechanisms in ettringite systems J. Bizzozero, C. Gosselin and K. L. Scrivener	284
27	Volume stability of calcium aluminate cement and calcium sulfoaluminate cement systems M. P. Adams and J. H. Ideker	295
PART SIX – ADMIXTURES		307
28	Rheology of calcium aluminate cement based concrete: controlling the “pot life” M. Jolin, J.-D. Lemay, B. Bissonnette and É. Crépault	309

29	A new setting accelerator upon lithium sulfate technology for calcium aluminates based materials J. Estival, J. Mahiaoui, V. Watt, P. Taquet and J. F. Colombet	321
30	Polycarboxylate ether based superplasticiser for calcium aluminate cement mortars N. Ukrainczyk, J. Sipusic and N. Vrbos	333
31	Effect of PCE admixtures on fluidity, hydration and microstructure of calcium aluminate cement pastes M. M. Alonso, F. Puertas and M. Palacios	341
32	Formation of organo-mineral phases in calcium aluminate cement involving polycarboxylate superplasticizers O. Storcheva, S. Ng, J. Plank, I. Dekany, E. Metwalli and P. Müller-Buschbaum	352
33	The influence of mineralogical composition of high alumina cement on its physical - mechanical properties C. Stancu, N. Angelescu and M. Muntean	364
34	Action mechanism of admixtures in ettringite systems J. Pommay, H. Fryda, F. Bordet and D. Turlakis	371
35	Latex-modified calcium aluminate cement A. F. Bentivegna, J. H. Ideker and K. J. Folliard	383
36	Alkaline earth glycolates and their application as CAC admixtures R. Kaden and H. Pöllmann	396
PART SEVEN – AGEING OF FORMULATIONS		405
37	Ageing behaviour of SLU mortar formulations based on a ternary binder system comprising OPC/CAC/AH exposed to elevated moisture and atmospheric CO ₂ J. Plank, E. Dubina and M. R. Meier	407
38	Ageing of cement and drymix: consequences and solutions J. Mahiaoui, J. Estival and H. Fryda	422
PART EIGHT – CALCIUM ALUMINATE CEMENTS IN REFRACTORY APPLICATIONS		435
39	Testing of calcium aluminate cement bonded castables and influence of curing conditions on the strength development A. Buhr, D. Schmidtmeier, G. Wams, S. Kuiper and S. Klaus	437
40	Mixing optimization of an alumina based LC-castable by applying variable power inputs J. Kasper and O. Krause	450
PART NINE – CALCIUM ALUMINATE CEMENTS IN WIDE RANGING APPLICATIONS		457
41	Influence of sulfate on physical properties of quick-hardening cement compounds H. Hara, T. Higuchi, M. Morioka, T. Hurnaus, J. Plank and E. Sakai	459
42	Push-out bond strength of new calcium aluminate cement (endobinder) R. C. Morais, L. F. R. Garcia, F. C. P. Pires-de-Souza and H. L. Rossetto	470
43	The use of calcium aluminate cement in terrazzo type floor tiles T. Delibaş, Ö. Kirca and İ. Ö. Yaman	479

44	Durability of rapid-strength concrete produced with ettringite-based binders E. G. Moffatt and M. D. A. Thomas	488
45	Calcium aluminate cement application in lime binders proposed for architecture restoration A. Defus	498
PART TEN – DURABILITY		509
46	Development of an accelerated test of fungal biodeterioration: application to calcium aluminate cements A. Govin, I. Albuquerque and P. Grosseau	511
47	Influence of the chemical composition of mortars on algal biofouling E. Dalod, A. Govin, R. Guyonnet, P. Grosseau, C. Lors and D. Damidot	523
48	Mineralogy of a 90 years old structure “le tunnel des Valois” F. Sorrentino and D. Damidot	535
49	10 year exposure of Ciment Fondu mortars in a marine environment P. F. G. Banfill	545

CALCIUM ALUMINATES

Since its invention in 1908 calcium aluminate cement has been the subject of much research and because of its unique attributes has found its way into many applications. While it is still used to make mortars and concretes in the same way as Portland cements but for challenging environments (heat, abrasion, rapid hardening, chemical resistance, etc.), the last decades have seen its steady growth in a wide range of blended cements systems sold as “dry-mixes”, like tile adhesives and self-levelling underlayments. Another growing field of application is for waste water infrastructures as it demonstrates exceptional resistance to microbiologically induced corrosion.

In fact, calcium aluminate cement is often “an enabling technology” that allows solutions to be found for difficult applications where the alternatives may be more costly and environmentally unfriendly. The papers included in these proceedings of the international conference held in Avignon, France, in 2014, demonstrate continuing research and development in academia and industry, with new products and uses regularly coming on stream.

This volume includes recent work on all aspects of calcium aluminates, starting from their mineralogy, hydration and physical performance through to their durability in various environments, including the ongoing evolution of calcium aluminate technology. Attention is also given to their applications, including: admixtures, building chemistry formulations, refractory applications, civil engineering and architectural uses and continued developments for biogenic corrosion resistance applications.
